1.0 EVALUATION SCOPE
1.1 Compliance with the following codes:
- 2015, 2012 and 2009 International Residential Code® (IRC)

Properties evaluated:
- Exterior veneer
- Wind load resistance—transverse
- Types I, II, III and IV construction
- Fire-resistance-rated construction

1.2 Evaluation to the following green code(s) and/or standards:
- 2013 California Green Building Standards Code (CALGreen), Title 24, Part 11

Attributes verified:
- See Section 3.0

2.0 USES
CertainTeed vinyl sidings, which are also sold under the brand names Vytec and Vinyl Carpentry, are used as exterior wall coverings on buildings of all construction types over approved sheathings; and as closures on the underside of exterior roof eaves (soffits).

3.0 DESCRIPTION
The CertainTeed, Vytec and Vinyl Carpentry vinyl sidings and soffits are extruded from polyvinyl chloride (PVC) resins. The siding panels conform to the requirements of ASTM D3679 and are formed with an upper edge having nail slots and a lower edge that hooks into the upper edge of the lower course. The accessory items, used to detail the application of the product as an exterior wall covering, are of the same material.

All siding panels are designed with receiving legs and a nailing flange with pre-punched elongated nailing slots. All siding panels used in horizontal applications have weep holes pre-punched at a maximum of 17 inches (432 mm) on center on the underside to provide ventilation and drainage.

The siding panels are available in different colors with a smooth finish or embossed with a matt or wood-grain texture. The siding panels range in thickness from 0.036 inch to 0.50 inch (0.914 mm to 1.27 mm).

The accessory shapes include a fascia, “F” shaped trim, “J” shaped trim, drip cap, starter strips, inside/outside corners, quarter round soffit molding, undersills, soffit cove trim, and “H” divider bar. The thicknesses of accessories range from 0.040 to 0.050 inch (1.02 to 1.27 mm).

Refer to Table 1 for panel thicknesses, lengths and profiles within the scope of this report.

The attributes of the CertainTeed vinyl sidings have been verified as conforming to the provisions of (i) CALGreen Sections A4.405.1.3 (prefinished materials) and A5.406.1.2 (reduced maintenance); (ii) ICC 700-2012 Sections 601.7, 11.601.7, and 12.1(A).601.7 (site-applied finishing materials); and (iii) ICC 700-2008 Section 601.7 (site-applied finishing materials). Note that decisions on compliance for those areas rest with the user of this report. The user is advised of the project-specific provisions that may be contingent upon meeting specific conditions, and the verification of those conditions is outside the scope of this report. The code may provide supplemental information as guidance.

4.0 INSTALLATION
4.1 General:
Installation must be in accordance with IBC Section 1405.14 or 2015 IRC Sections R703.3.1 and R703.11 (2012 and 2009 IRC Section 703.4 and R703.11) and 2015...
4.2.1 Horizontal Siding: For horizontal siding, a starter strip must be installed horizontally along the bottom of the area to be sided. The starter strip must be fastened to the building every 8 inches (203 mm) to 10 inches (254 mm) in slots provided in the strip. The first horizontal siding panel must be locked into the starter strip and fastened to the building through the center of the nailing slots at the maximum spacing specified in Table 2 of this report, as applicable. The fasteners must be located in the center of the slot, leaving a minimum 1/32-inch (0.8 mm) space between the fastener head and the face of the vinyl nailing strip, to allow for expansion. Succeeding panels must be similarly installed, locking into the panel below. The horizontal siding panel ends must be overlapped 1 inch (25.4 mm) at butt joints and held 1/4 inch (6.35 mm) clear of all vertical accessory members at wall ends and around openings.

4.2.2 Vertical Siding: Vertical siding must be interlocked and fastened, using the appropriate accessory components and fastening methods to secure the panels and allow for expansion in accordance with Table 2 and the manufacturer’s published installation instructions.

4.3 Soffit Installation:
Soffit must be installed and fastened in accordance with the manufacturer’s published installation instructions, also taking into account the high wind limitations of Table 2.

4.4 Fasteners:
The fasteners for attaching the siding must be corrosion-resistant nails having 0.313-inch-diameter (7.95 mm) heads and 0.120-inch-diameter (3.05 mm) shanks. For installation over wood-based sheathing (minimum equivalent specific gravity, G = 0.42), fasteners must be long enough to penetrate the underlying framing at least 3/4 inch (19.1 mm). When sheathing, other than wood-based sheathing is used, fasteners must penetrate a minimum of 1 3/4 inches (31.8 mm) into framing.

Corrosion-resistant staples may be used where indicated in Table 2. Staples must be no. 16 gage, with a minimum length of 1 1/2 inches (44.4 mm) and a crown width of 1/16 inch (11.1 mm). For installation over framing and wood-based sheathing (minimum equivalent specific gravity, G = 0.42), minimum staple embedment into framing must be 3/4 inch (19.1 mm).

4.5 Types I, II, III and IV Construction:
The vinyl siding may be installed on the exterior of buildings of any type of construction when installed over maximum 1-inch-thick (25.4 mm) expanded polystyrene insulation [1 pound per cubic foot (16 kg/m³)] and mechanically fastened with noncorrosive, self-tapping, 2 1/2-inch-long (64 mm) screws with minimum 3/16-inch-diameter (9.5 mm) heads and 1/8-inch-diameter (3.2 mm) shafts, and with minimum 3/16-inch-diameter (15.9 mm) nylon washers, to the exterior of a steel stud wall constructed with 1/2-inch-thick (12.7 mm) os screw wall board on the exterior and 3/8-inch-thick (15.9 mm) Type X gypsum wall board on the interior. The assembly described in this section must be limited to installations exposed to maximum basic wind speeds (3-second gust) of 100 miles per hour (161 km/h) on structures a maximum of 40 feet (12 192 mm) in height under the IBC.

4.6 Fire-resistance-rated Construction:
4.6.1 One-hour Fire-resistance-rated Limited Load-bearing Wood Stud Wall: Wood studs must be nominal 2-by-4 Douglas fir marked “STD & BTR, Doug. Fir, S-Dry,” spaced 16 inches (406 mm) on center. The wall must be constructed with a single bottom plate and double top plates. The wall is a maximum of 10 feet (3.05 m) in height with double 2-by-4 wood fire blocking located at 8 feet (2.44 m) above the bottom plate. Stud cavities must be filled with 3/12-inch-thick (88.9 mm), R-11, mineral wool insulation batts. The stud wall must be covered on the exterior with one layer of 1/2-inch-thick (12.7 mm), exterior gypsum sheathing, and on the interior face with a single layer of 3/16-inch-thick (15.9 mm), Type FSW, fire-resistant gypsum wall board. The exterior wall sheathing must be covered with a water-resistive barrier. The studs are assembled with two 16d smooth box nails on each end. The wall board is installed vertically with 1 1/4-inch-long (44.4 mm), No. 6, bugle head drywall screws spaced 8 inches (203 mm) on center around the perimeter of the board and along the studs. Vertical joints are staggered on opposite sides of the wall. The joints must be treated with ready-mixed joint compound and spark- perforated paper joint reinforcing tape. The siding must be attached to the studs using 2-inch-long (38.1 mm) roofing nails with flat heads, spaced 8 inches (203 mm) on center along the stud.

The axial load capacity of the wall is limited to a maximum load of 1050 pounds (4670 N) per stud or 32 percent of maximum design load calculated under the AF&PA National Design Specification for Wood Construction (NDS).

4.6.2 Fire-resistance-rated Walls on Buildings of Type V Construction under the IBC: The vinyl siding may be installed over code-complying, exterior, fire-resistance-rated bearing or nonbearing walls required to be of Type V construction under the IBC without affecting the hourly rating of the walls.

4.7 Wind Resistance:
4.7.1 General: The design wind pressure must be determined in accordance with the requirements of Chapter 16 of the IBC or Section R301.2.1 of the IRC, as applicable, and must not exceed the allowable values in Table 2, subject to the conditions in Sections 4.7.2 and 4.7.3. Wind resistance of soffit panels is outside the scope of this report except where specifically listed in Table 2 and where installation is as siding.

4.7.2 IBC: For buildings constructed under the requirements of the IBC, vinyl siding must be installed as described in IBC Section 1405.14 and Sections 4.1

IRC Table R703.3(1) (2012 and 2009 IRC Table R703.4), as applicable, ASTM D4756, the manufacturer’s published installation instructions, and this report. The manufacturer’s published installation instructions must be available on the jobsite during installation.
through 4.6 of this report, as applicable, over sheathings or materials addressed in IBC Section 2304.6 that are capable of independently resisting both positive and negative wind pressures occurring under design conditions at the building location. The allowable negative wind loads for the vinyl siding are as shown in Table 2. Positive wind pressures are not considered for the siding, since the sheathing must be capable of supporting the imposed loads.

4.7.3 IRC: For buildings constructed in accordance with the IRC, the siding must be installed as described in Sections 4.1 through 4.6 and in accordance with one of the following conditions:

1. For installation over sheathings other than foam plastic sheathings: For applications under the 2015 IRC where the design wind pressure does not exceed 30 psf or the ultimate wind speed (3-second gust) does not exceed the limits in Table R703.3(1), installation shall comply with the prescriptive requirements of IRC Section R703.11.1 and Table R703.3(1). Under the 2012 and 2009 IRC, in applications where the building’s mean roof height does not exceed 30 feet (9144 mm) and the basic wind speed (3-second gust) is less than 110 mph (49 m/s) in Exposure B, and does not exceed 90 mph (40 m/s) in Exposure C or 85 mph (38 m/s) in Exposure D, sheathing, other than foam plastic, must be as required by Table R703.4) of the 2012 and 2009 IRC.

For wind conditions exceeding those listed above, the siding must be installed over sheathing that is capable of independently resisting both positive and negative wind pressures occurring under the design conditions at the building location. The allowable negative wind loads for the vinyl siding are as shown in Table 2. Positive wind pressures are not considered for the siding, since the sheathing must be capable of supporting the imposed loads, including but not limited to, positive and negative transverse wind pressures.

2. For installation over foam plastic sheathing: For installation over foam plastic sheathing, in the absence of other approved backing capable of independently resisting the design wind pressure, the siding must be installed in accordance with Section R703.11.2 of the IRC.

5.0 CONDITIONS OF USE

The CertainTeed Vinyl Sidings and Soffits described in this report comply with, or are suitable alternatives to what is specified in, those codes listed in Section 1.0 of this report, subject to the following conditions:

5.1 Installation complies with this report, the manufacturer’s published instructions and the applicable code. In the event of a conflict between the manufacturer’s published installation instructions and this report, this report governs.

5.2 The siding is limited to maximum design wind pressures shown in Table 2 of this report.

5.3 In jurisdictions adopting the IRC, the siding must be installed in accordance with Section 4.7.3 of this report and 2015 IRC Table R703.3(1) (2012 and 2009 IRC Table R703.4) and limited to areas where the design wind pressure does not exceed the values shown in Table 2 of this report.

5.4 The exterior walls must be braced or sheathed to resist racking loads with approved materials in accordance with the requirements of the applicable building code.

5.5 When installation is on Types I, II, III and IV construction (IBC) and fire-resistance-rated construction, refer to Sections 4.5 and 4.6 of this report, respectively.

5.6 The siding may be installed on buildings of any construction type under the IBC or buildings under the IRC, and at a fire separation distance of greater than 5 feet (1524 mm) in accordance with 2015 and 2012 IBC Section 1406.2.1.2 (2009 IBC Section 1406.2.1.2) or 2015 IRC Table R302.1(1) and R302.1(2) (2009 IRC Table R302.1), as applicable.

5.7 The sheathing must be covered with a water-resistant barrier, as required by the applicable code.

5.8 The siding is manufactured in Jackson, Michigan; Claremont, North Carolina; and Williamsport, Maryland, under a quality-control program with inspections by ICC-ES.

6.0 EVIDENCE SUBMITTED

6.1 Data in accordance with the ICC-ES Acceptance Criteria for Vinyl Siding (AC37), dated February 2014 (Editorially revised July 2015).

6.2 Test reports in accordance with NFPA 268 and ASTM E119.

7.0 IDENTIFICATION

The vinyl sidings and soffits described in this report are identified by a stamp bearing the brand name (CertainTeed, Vytec or Vinyl Carpentry), the product name and style, the statement “Conforms to ASTM Specification D3679,” and the evaluation report number (ESR-1066).

For SI: 1 inch = 25.4 mm, 1 psf = 0.0479 kpa
³Studs are minimum 2-by-4 wood with a minimum specific gravity of 0.42.
²Nails and staples must be as specified in Section 4.4.
³ Minimum nominally ½-inch thick wood-based sheathing having a minimum specific gravity of 0.42, or other materials having equivalent withdrawal resistance.
1.0 REPORT PURPOSE AND SCOPE

Purpose:
The purpose of this evaluation report supplement is to indicate that the CertainTeed vinyl sidings and soffits, recognized in ICC-ES master evaluation report ESR-1066, have also been evaluated for compliance with the codes noted below.

Applicable code editions:
- 2013 California Building Code® (CBC)
- 2013 California Residential Code® (CRC)

2.0 CONCLUSIONS

2.1 CBC:
The CertainTeed vinyl sidings and soffits, described in Sections 2.0 through 7.0 of the master evaluation report ESR-1066, comply with CBC Chapter 14, provided the design and installation are in accordance with the International Building Code® provisions noted in the master report and the applicable provisions of the CBC.

The CertainTeed vinyl sidings and soffits have not been evaluated under CBC Chapter 7A for use in the exterior design and construction of new buildings located in a Fire Hazard Severity Zone within State Responsibility Areas or any Wildland–Urban Interface Fire Area.

2.2 CRC:
The CertainTeed vinyl sidings and soffits, described in Sections 2.0 through 7.0 of the master evaluation report ESR-1066, comply with CRC Chapter 7, provided the design and installation are in accordance with the International Residential Code® provisions noted in the master report and the applicable provisions of the CRC.

The CertainTeed vinyl sidings and soffits have not been evaluated under CRC Section R327 for use in the exterior design and construction of new buildings located in a Fire Hazard Severity Zone within State Responsibility Areas or any Wildland–Urban Interface Fire Area.

The products recognized in this supplement have not been evaluated for compliance with the International Wildland–Urban Interface Code®.

This supplement expires concurrently with the master report, reissued May 2017.
1.0 REPORT PURPOSE AND SCOPE

Purpose:
The purpose of this evaluation report supplement is to indicate that CertainTeed Vinyl Siding and Soffits, recognized in ICC-ES master report ESR-1066, have also been evaluated for compliance with the codes noted below.

Applicable code editions:
- 2014 Florida Building Code—Building®
- 2014 Florida Building Code—Residential®

2.0 CONCLUSIONS

The CertainTeed Vinyl Siding and Soffits, described in Sections 2.0 through 7.0 of the master evaluation report ESR-1066, comply with the 2014 Florida Building Code—Building® and the 2014 Florida Building Code—Residential®, provided the design and installation are in accordance with the International Building Code® provisions noted in the master report and the following conditions apply:

- For buildings constructed under the 2014 Florida Building Code—Building®, the vinyl siding must be installed as described in Section 1405.14 of that code.
- For buildings constructed under the 2014 Florida Building Code—Residential®, the siding must be installed as required by Section R703.11 of that code.
- Soffit pieces must be labeled and installed in accordance with the requirements of Section 1710.9 of the Florida Building Code—Building®.

Use of the CertainTeed Vinyl Siding and Soffits for compliance with the High-Velocity Hurricane Zone provisions of the 2014 Florida Building Code—Building® and the 2014 Florida Building Code—Residential® has not been evaluated and is outside the scope of this evaluation report.

For products falling under Florida Rule 9N-3, verification that the report holder’s quality-assurance program is audited by a quality-assurance entity approved by the Florida Building Commission for the type of inspections being conducted is the responsibility of an approved validation entity (or the code official, when the report holder does not possess an approval by the Commission).

This supplement expires concurrently with the master report, reissued May 2017.
